

# Printing – Full Colour, High Impact

## What is UV DTF Printing?

UV DTF (Direct-To-Film) printing is an advanced digital process that combines the best of **DTF** and **UV printing**.

It uses **UV-curable inks** to print your design onto a special transfer film, which is then cured with UV light.

The design is applied by pressing the film onto the product surface and simply peeling away the top sheet — leaving a vibrant, durable print in place.

## How It Works

UV DTF printing is fast and easy, with no powder shaking, weeding, or screen setup required:

1. Prepare your artwork.
2. Print the design directly onto transfer film.
3. Cut the design to shape (sticker or wrap).
4. Clean and dry the product surface.
5. Peel off the backing and apply the design.
6. Leave for 24 hours, then remove the cover sheet.

## Why Choose UV DTF?

- **Photo-Realistic Quality** – rich, vibrant colours with fine detail and depth.
- **Durable Finish** – water and fade resistant.
- **No Coatings Needed** – applies directly to most hard surfaces.

## Versatile Applications

UV DTF works on a wide range of **hard, curved, or uneven surfaces** including:

- Metal
- Glass
- Ceramic
- Plastic
- Powder-coated items
- Wood

Whether it's drinkware, tools, hard coolers, or outdoor gear — UV DTF delivers a premium, long-lasting print without the limitations of traditional methods.
